Creating and Configuring Domains Using the Configuration Wizard When you are ready to start developing or testing applications, use the Configuration Wizard to create and configure a domain. A domain is a collection of resources, such as servers, clusters, database connections, security services, and J2EE applications, that you manage as a unit.

Creating and Configuring Domains Using the Configuration ...
Otherwise, for high power and flexibility, use the configuration mode (manual configuration). Note: Before you begin, disconnect all the WAN cables from Cisco VG400 to prevent it from running the Autoinstall process. Cisco VG400 attempts to run Autoinstall whenever you power the Voice Gateway on and there is a WAN connection on both ends.

Cisco VG400 Voice Gateway Software Configuration Guide ...
Configuration changes, including switches, can have a significant impact on the FAH client, good or bad, so only make a change when absolutely sure of what the change will do. It is always better to read the FAQs and understand the settings than to crash the client with experimentation and corrupt work units which loses points.

Using Configuration Files. There are two ways to use configuration files. The first is to save the file wherever you would like and pass its location to the CLI using the -c option, such as: eslint -c myconfig.json myfiletotest.js The second way to use configuration files is via .eslintrc.* and package.json files. ESLint will automatically look for them in the directory of the file to be linted, and in successive parent directories all the way up to the root directory of the filesystem.

Configuring ESLint - ESLint - Pluggable JavaScript linter
Demonstrated with T2600G-28TS, this chapter provides configuration procedures in two ways: using the GUI and Using the CLI. 3.3 Using the GUI 1) Choose the menu MAINTENANCE > sFlow > sFlow Agent to load the following page. Enable sFlow Agent, set the switch IP address 192.168.0.26 as the Agent address, and

The other config flag lets the clients know they can use DHCPv6 to receive additional configuration and the server command direct the clients to the DHCP pool we created above. Now we are done: The router will learn it's ipv6 prefix from BT and each client will learn it's /64 subnet via NDP and autoconfigure using SLAAC.
